Genes with similarity to proteins in the databases are described
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
Informatics Group, Oak Ridge National Laboratory,
http://compbio.ornl.gov/Grail-1.3/),
GENSCAN (Chris Burge, MIT, http://CR-081.mit.edu/GENSCAN.html),
GENSCAN (Chris Burge, MIT, http://CR-081.mit.edu/GENSCAN.html),
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremlini.zool.lastate.edu/cgi-bin/sp.cgi).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence may not be the entire insert of this clone. For the latest information on annotation of this clone, please see
http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=KlB16
Genes with similarity to proteins in the databases are described in
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
(Informatics Group, oak Ridge National Laboratory,
http://compbio.ornl.gov/Grail-1.3/),
CENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremlinl.zool.iastate.edu/cgi-bin/sp.cgi).
Genes encoding tRNAs are predicted by tRNAscan-SE
(Sean Eddy, Washington University School of Medicine, St. Louis,
http://genome.wustl.edu/eddy/tRNAscan-SE/).
This sequence may not be the entire insert of this clone. It may be
shorter because we remove overlaps between neighboring submissions.
The 5' clone is MNR13 and the 3' clone is MHK7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and Tabata,S.
Structural analysis of Arabidopsis thaliana chromosome 5. VII.
Structural analysis of Arabidopsis thaliana chromosome 5. VII.
Sequence features of the regions of 1,013,767 bp covered by sixteen physically assigned P1 and TAC clones
DNA Res. 5 (5), 297-308 (1998)

                                                                                                                                                                                                                                                                                                                                                                                                                         Submitted (02-JAN-1996) Sanger Centre, Hinxton, Cambridgeshire, Submitted (02-JAN-1996) Sanger Centre, Hinxton, Cambridgeshire, On May 24, 1996 this sequence version replaced gi:11475BL.
IMPORTANT: This sequence is not the entire insert of clone upon. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone U9D4 is at 1 in this sequence. The true left end of clone U2JD1 is at 37084.
USD4 is from the human chromosome X-specific cosmid library.
                                                                                                                                                                                              HSU9D4 37184 bp DNA PRI 23-NOV-1999
Human DNA sequence from cosmid U9D4, between markers DXS366 and
DXS87 on chromosome X.
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
Eutheria; Primates; Catarrhini; Hominidae; Homo.

are included to maintain the nucleotide numbering
given in the specification for this DNA sequence"
                                                                                                                                                                                                                                                                                   A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Computer readable medium; vaccine; S.aureus infection; immunodetection; cellulitis; eyelid infection; food poisoning; osteomyelitis; therapy; skin infection; surgical wound infection; scalded skin syndrome;

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, coalded skin syndrome, tot. Organisms transformed with the DNA sequences can be used for the complaint production of the polypeptides. The new DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó

Polynucleotide(s) and proteins derived from Staphylococcus aureus stored on computer readable medium and used in the production of anti-S.aureus vaccines

Claim 1; Page 1479-1482; 3271pp; English.

of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences C homologues of any of the S.aureus DNA sequences contained on the This sequence represents one of 5191 Staphylococcus aureus DNA sequences computer readable medium.

```
The present DNA sequence is the rat smooth muscle alpha actin (SM alphaA) gene 5' regulatory sequence, comprising the promoter and first intron. It corresponds to bases -2558 to 4-784 of the SM alphaA gene. An intronic fragment from 4-73 to -1098 bp relative to the start of transcription is bighly conserved and contains cis-acting elements required to direct antiproliferative and cardiant activity. The SM alphaA regulatory sequence is useful to inhibit and treat smooth muscle cell (SMC)-related cancers or other proliferative disorders. It is also used for the treatment of SMC-related disorders, like coronary artery disease, stroke, hypertension, asthma and multiple gastrointestinal, urogenital and reproductive disorders. It is also used in gene therapy.
Isolated polynucleotide is used for inhibiting or treating smooth muscle cell-related cancer or other proliferative disorders and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 5342 BP; 1533 A; 1178 C; 1127 G; 1504 T; 0 other;

Enterococcus faecalis; contig; detection; Enterococcal infection; vaccine; attenuation; computer readable medium; ds. (HUMA-) HUMAN GENOME SCI INC. 97US-0066009. 97US-0044031. 97US-0046655. 98WO-US08985. Enterococcus faecalis. WO9850555-A2 04-MAY-1998; 14-NOV-1997; 06-MAY-1997; 12-NOV-1998

Enterococcus faecalis genome contig SEQ ID NO:326.

New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus

Kunsch CA;

Barash SC, Dillon PJ,

WPI; 1999-045171/04.

Claim 1; Page 1421-1424; 2084pp; English.

982 nucleotide sequences isolated from the Enterococus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence diagnosang faecalis in samples. They can also be used for progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivor or in vitro. In particular the products encoded by the Enterococcus faecalis, or polypeptides encoded by the Enterococcus faecalis nucleotide sequences and be used in very modulate the grown or in vitro. In particular the grown or in vitro. In particular the grown or in vitro is the procession of an be used to mother related organism, in vivor or in vitro. In particular the grown or in vitro is the procession of an be used in vaccines to prevent or attenuate an Enterococcal computer readable medium has been developed which has recorded on it

of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or required trained from sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "these bases represent a line of missing text in
the sequence listing in the specification. They
are included to maintain the nucleotide numbering
given in the specification for this DNA sequence"

Human PLAG1 gene; PLAG1; tumourigenesis gene; T-gene; PLAG2; CTNNB1; antibody; benign tumour; malignant tumour; leukaemia; lymphoma; cancer; inhibition; ss.

Nucleotide sequence of human PLAG1.

21-AUG-1998 (first entry)

V29268;

```
This is the nucleotide sequence of the human PLAGI gene. It is a tumourigenesis gene (T-gene), which is isolated in the form of PLAGI, tumourigenesis gene (T-gene), which is isolated in the form of PLAGI, point Grankly genes. Their proteins can be used as a starting point for preparing antibodies for clinically/medically diagnosing cells having a non-physiological proliferative capacity as compared to wild type cells, where the former cells are selected from both chenign and malignant tumours, as well as leukaemia and lymphomas. Derivatives of the T-gene are also used in the diagnosis and preparation of therapeutical compositions for the treatment of cancers, such as nucleic acid derivatives, and antibodies. The T-gene may be uses as a starting point for designing suitable expression-modulating compounds or techniques for the treatment of non-physiological compounds in humans or animals. Expression inhibitors of the T-gene can be used in the treatment of diseases involving

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Q86693 encodes R72576 Candida tropicalis pK233 isocitrate lyase (ICL). By isolating the expression controlling region of Q86693, the claimed promoter sequences Q86694-Q86705 were prepd. These promoter sequences can be used in the prepn. of heterologous proteins, in eukaryotic and prokaryotic host cells.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can also be used in a varcine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyalitis, skin and surgical wound infections, food poisoning, costeomyalitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "these bases represent a line of missing text in

```
This sequence represents a E. coli strain 196 contig containing pathogenicity island (PAI) sequences, and represents a nucleic acid molecule of the invention. PAIS are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from PAI IV and PAI IV is located at approximately 64 min (near pheV) on the E. coli crimomosome and is greater than 170 kb. PAI V is located at approximately 94 min (at pheR) on the E. coli chromosome and is approximately 160 kb in size. Antibodies specific to the proteins encoded by the PAI open reading frames of the invention can be used in kits to detect uropathogenic E. coli. The proteins are used in vaccines to elicit a protective immune response in an animal to the uropathogenic E. coli
                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PAI; pathogenicity island; uropathogenic E. coli detection; PAI IV; pheR; PAI V; pheV; vaccine; protective immune response; ds.

The present invention describes a computer readable medium which has
the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded
the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded
to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEO ID NO:1
to 391 (V52134 to V52524) are genomic fragments from Streptococcus
to 391 (V52134 to V52524) are genomic fragments from Streptococcus
condecule encoding a homologue of any of the fragments of the S. pneumoniae
complexity and the member of any of the fragments of the S. produced
by a process comprising: (a) screening a genomic DNA library using as a
complexity sequence defined by any of the sequences in SEQ ID NO:1
to 391, identifying members of the library which contain sequences
that hybridise to the target sequence and isolating the nucleic acid
molecules from the members; or (b) isolating the nucleic acid
from an organism, amplifying nucleic acid molecules whose nucleotide
sequence is homologous to amplification primers derived from the
fragment of the S. pneumoniae genome to prime the amplification and

Diagnosis of osteoporosis by determining genotype of interleukin-1 receptor antagonist gene - useful for diagnosing patient pre-disposition or susceptibility to osteoporosis and for therapeutic intervention

Disclosure; Page 21-27; 36pp; English.

A method has been developed for the diagnosis of osteoporosis comprising determining the genotype of an interleukin-1 (IL-1) receptor antagonist gene (IL-1RN). The present sequence represents the human interleukin-1 receptor antagonist gene. The method can be used for the diagnosis of disease, including diagnosis of osteoporosis and predisposition or susceptibility to osteoporosis and for therapy.

bright to determine at least one allele of an interleukin-1 (IL-1)

proinfilammatory haplotype. A method has also bee described for

proinfilammatory haplotype. A method has also bee described for

determining a subject; susceptibility to developing chronic obstructive

alway disease (COAD) or for predicting the rapidity or ultimate

progression of a COAD in the subject by: (a) obtaining a nucleic acid

IL-1 proinfilammatory haplotype in the sample, where detection of at

least one of these alleles indicates that the patient has an increased

the susceptibility to developing COAD. The method is useful for determining

the susceptibility of subjects to developing chronic obstructive airway

chronic obstructive airway disease (COAD). COAD can be astima, emphysema,

chronic bostructive airway disease (COAD). COAD can be astima, emphysema,

chronic bostructive airway disease (COAD). COAD can be astima, emphysema,

carly identification of chronic obstructive airway disease (COAD).

facilitating administration of appropriate treatment at the earliest

stage, thereby increasing the probability of a positive outcome. The

present sequence represents the human IL-IRN gene. Sequence 12565 BP; 3217 A; 2980 C; 3072 G; 3294 T; 2 other;

GENERAL INFORMATION:
APPLICANT: Futreal, Phillip A
APPLICANT: Ashworth, Alan
APPLICANT: Astracton, Michael R
TITLE OF INVENTION: Materials and methods relating to the
TITLE OF INVENTION: identification and sequencing of the BRCA2 cancer
TITLE OF INVENTION: susceptibility gene and uses thereof.

/dev_stage="Roots harvested at 10, 17, 22, 31 and 38 days post-inculation with Glomus versiforme. The library was made from a mixture of RNA from each of these stages."
/lab_host="E. coli strain SOLR"
/hote="Vector: pBluescript SK-; Site_1: EcoRI; Site_2: Khoi; cDNA was prepared from polyA+ enriched RNA from roots harvested at 10, 17, 22, 31 and 38 days post-incoulation with Glomus versiforme. The cDNA was directionally ligated into the Unizap RN vector from extracts. Plasanids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in SOLR cells."
